The main concept of our project is to rehabilitate and redesign the campus of Palestine Polytechnic University and neighboring areas from all sides and considerations with respect of ( environmental , urban planning and architectural design ) standards .

After analyze and study of the current campus and the future needs for the university , we added 18,000 m sq. to the campus land and 4 buildings ( Engineering , Applied Professions , Cafeteria , and Student Activities ) , gardens , and courts .

All these areas and buildings will create a suitable campus in a shape that facilitate the movement of students and vehicles by adding pedestrian tracks and managing the streets inside the campus or outside it by create clear main axes which intersected with sub-passages for colleges buildings and their services .

These axes and passages confirms the studied optical axis starts from the main court which we suggested from the center of the campus to break the boredom which dominant in the current campus .
